ivanovitch.silva@ufrn.br

What now?

Step #01

4

Data science technology for a better world.

Anaconda offers the easiest way to perform Python/R data science and machine learning on a single machine. Start working with thousands of open-source packages and libraries today.

Download

For MacOS

Python 3.9 • 64-Bit Graphical Installer • 515 MB

Get Additional Installers

The screenshot shows the Anaconda Navigator application window. The title bar says "Anaconda Navigator". The main interface has a sidebar on the left with "Home", "Environments", "Learning", and "Community" options. The main panel displays a list of packages. At the top, there's a filter dropdown set to "Installed", buttons for "Channels" and "Update index...", and a search bar labeled "Search Packages". The package list has columns for "Name", "Description", and "Version".

Name	Description	Version
✓ _ipyw_jlab_nb_ex...	A configuration metapackage for enabling anaconda-bundled jupyter extensions	0.1.0
✓ alabaster	Configurable, python 2+3 compatible sphinx theme.	0.7.12
✓ anaconda	Simplifies package management and deployment of anaconda	2020.11
✓ anaconda-client	Anaconda cloud command line client library	1.7.2
✓ anaconda-project	Tool for encapsulating, running, and reproducing data science projects	0.8.4
> ✓ applaunchservices		0.2.1
✓ appnope	Disable app nap on os x 10.9	1.0.0
✓ appscrip	Control applescriptable applications from python.	1.1.1
✓ argh	The natural cli.	0.26.2
✓ argon2-cffi	The secure argon2 password hashing algorithm.	20.1.0
✓ asn1crypto	Python asn.1 library with a focus on performance and a pythonic api	1.4.0
✓ astroid	A abstract syntax tree for python with inference support.	2.4.2

340 packages available

<https://www.anaconda.com>

Step #02

5

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).

Owner *

Repository name *

 ivanovitchm ▾

/

Great repository names are short and memorable. Need inspiration? How about [animated-invention?](#)

Description (optional)

Public

Anyone on the internet can see this repository. You choose who can commit.

Private

You choose who can see and commit to this repository.

Initialize this repository with:

Skip this step if you're importing an existing repository.

Add a README file

This is where you can write a long description for your project. [Learn more](#).

Add .gitignore

Choose which files not to track from a list of templates. [Learn more](#).

.gitignore template: Python ▾

Step #03

Environment Setup

Create a conda environment with `environment.yml` :

```
conda env create --file environment.yml
```

To remove an environment in your terminal window run:

```
conda remove --name myenv --all
```

To list all available environments run:

```
conda env list
```

To activate the environment, use

```
conda activate myenv
```

```
1  name: colab2deploy
2  channels:
3    - conda-forge
4    - defaults
5  dependencies:
6    - numpy=1.21.5
7    - uvicorn=0.17.5
8    - gunicorn=20.1.0
9    - requests=2.27.1
10   - fastapi=0.74.0
11   - scikit-learn=1.0.2
12   - python=3.8
13   - jupyterlab=3.2.9
14   - jupyter=1.0.0
15   - ipywidgets=7.6.5
16   - jupyterlab_widgets=1.0.2
17   - git=2.34.1
18   - pydantic=1.9.0
19   - yaml=0.2.5
20   - pip=21.3.1
21   - pandas=1.3.5
22   - pytest=6.2.5
23   - wandb=0.12.14
```

Step #04

FastAPI

- 1) Web framework for developing RESTful APIs in Python
- 2) It is fast in execution and also in development
- 3) Easy to use (CRUD) and production-friendly
- 4) post, get, put, patch, delete docs, path, query, authentication

An ASGI web server, for Python.

```
from typing import Union
```

```
def foo(a: Union[list,str], b: int = 5) -> str:  
    pass
```

Python Type Hinting

Real Python

Step #05

Local API Testing

8

```
from fastapi.testclient import TestClient
```

Running FastAPI via uvicorn
is easy, but clunky for testing

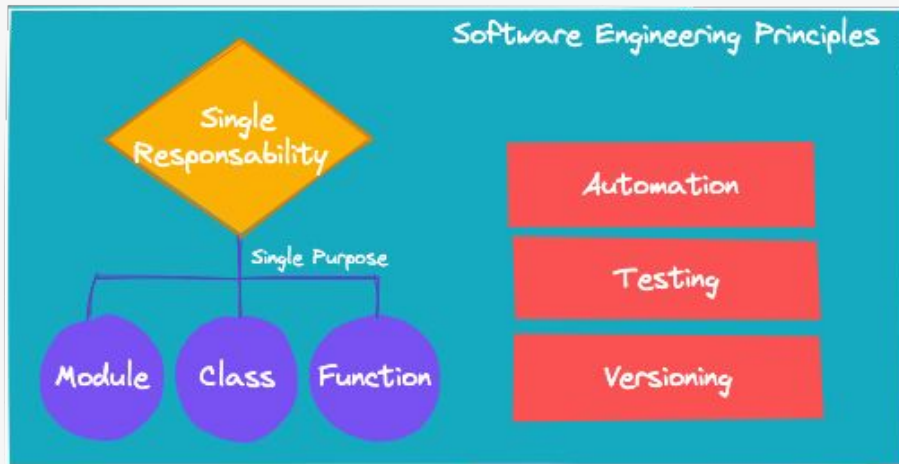

```
(colab2deploy) > uvicorn source.query.main:app --reload colab2mlops -> main !  
INFO: Will watch for changes in these directories: ['/Users/ivanovitchsilva/colab2mlops']  
INFO: Uvicorn running on http://127.0.0.1:8000 (Press CTRL+C to quit)  
INFO: Started reloader process [96831] using statreload  
INFO: Started server process [96833]  
INFO: Waiting for application startup.  
INFO: Application startup complete.  
INFO: 127.0.0.1:57620 - "GET / HTTP/1.1" 200 OK
```

Step #06

9

The practice of often fitting code into the overall code base

- Test suite
- Build/compile whenever we push changes

Continuous Integration
(CI)

Continuous Delivery
(CD)

The practice of making our code always deployed

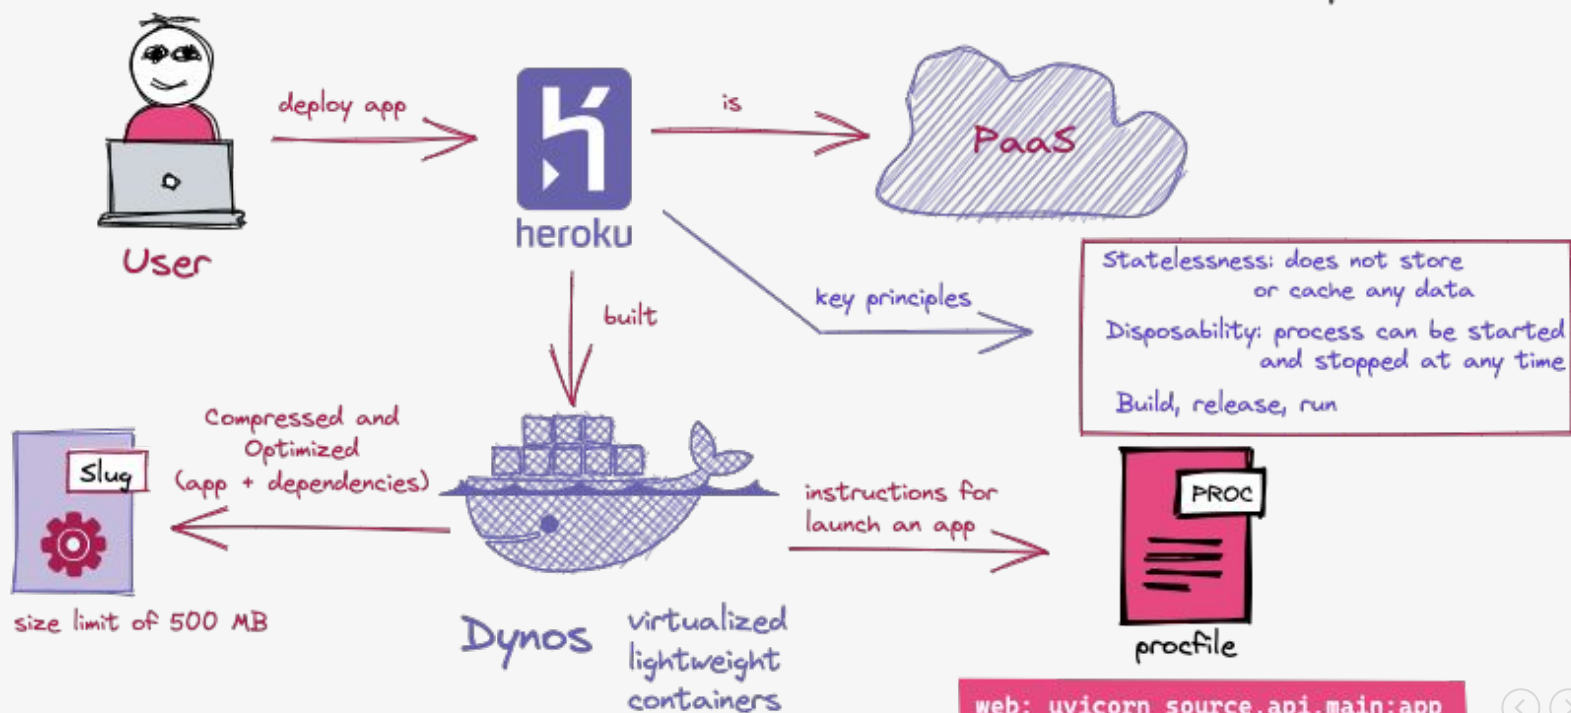

- Code gets verified by CI then auto-pushed into production

Step #07

10

Continuous Delivery with Heroku

web: `unicorn source.api.main:app`
